FRENCH ALPS, 1962

130 metres underground. No clock. Two months.

> What happened to his sense of time?

Michel Siffre, 23, a French geologist.

130 m

Depth of his camp in the Scarasson abyss

He camps beside an underground glacier.

No watch

No daylight

Cold, wet air

He logs every wake, meal and sleep, and phones the surface.

Count to 120, one per second. It took five minutes.

SHOULD TAKE	ACTUALLY TOOK
2 minutes	**5 minutes**

His team calls it: the experiment is over.

He was sure it was August 20.

> He had lost almost a month.

His "psychological time" had compressed by a factor of two.

Your clock drifts without cues. Anchor it:

1. Outside light within an hour of waking
2. A steady wake time, weekends too
3. Dim screens and lights before bed
